## Why RTi?

Reading Technologies, Inc. has been at the forefront of advanced air system technology since 1986. Our innovations include compressor room desiccant and refrigerated dryers, mainline separators/coalescers, point-of-use dryers, and filter/regulator/lubricator units. Below is an explanation of how RTi uses its patented Inverse-Flow® Technology to give you the best clean, dry air for your painting needs.

The RTi brand prides itself on providing clean, dry air. Do you have specific requests? We build around your custom need. Call us to find out more: (800) 521-9200, or visit our website at [www.rti-pbe.com](http://www.rti-pbe.com).

## INVERSE-FLOW® TECHNOLOGY

- 1 Centrifugal Spinning**  
Water, dirt, and oil contaminants are spun in a downward circular motion through the air. The spinning action forces heavy particles outward, towards the drain.
- 2 Final Filter Media**  
Our elements are composed of interwoven cotton, polyester, and stainless steel. The filter captures excess sub-micron water droplets. Cotton holds the water particles and allows them to re-enter the air stream as harmless vapor. *Filtration to 1.0 micron.*
- 3 Stainless Steel Element**  
Pre-cleaned air enters a filter media composed of finely interwoven stainless steel mesh wires. The striated surface efficiently holds aerosols and liquid droplets, which then fall into the drain area. *Filtration to 3.0 micron.*
- 4 Inverse-Flow®**  
RTi's Inverse-Flow® process creates a condition where the air, spinning in a downward circular motion, changes direction 180° and begins to flow vertically upward. The contaminants are not capable of reversing direction and must separate from the air flow. This process prevents re-entrainment of contamination, which can occur in other filter systems.
- 5 Bowl and Drain Options**  
Bowls—metal or polycarbonate with metal guards.  
Drains—automatic float, manual, zero loss, or electronic.

### The Case for Aluminum Piping

- Aluminum pipe systems are much easier to install and to modify than steel or copper pipe systems. Labor savings of 65% can be achieved since aluminum pipe is supplied ready for use. Preparations beyond cutting, deburring, and chamfering are not required, nor are special tools needed. Aluminum pipe is calibrated, meaning that its diameter is strictly controlled. This means that associated quick connect components will fit securely.
- Aluminum pipe is much lighter than steel or copper pipe and does not require threading or soldering.
- The compressed air provided by a system built with aluminum piping is much cleaner than air delivered by a steel pipe system. Aluminum pipe systems can help meet the requirements of ISO 8573-1:2010 air quality standards, should the application require it. Cleaner air also means lower maintenance costs.
- Corrosion-resistant properties of aluminum pipe mean optimal air flow, reduced energy costs, and better air quality.
- The fittings used with aluminum pipe systems fit securely and leak far less than the fittings used with threaded systems. This translates directly into energy savings and improved plant productivity.

\*\*In order to make our air audit procedures more efficient and provide more in depth results for the shops, you can download an app called "Calculator of Air" (iPhone®) or "Michell Instruments" (Android™). You need to input 2 lines. The first is temperature which will always be 70° F (paint company recommended temperature). The second is the dew point from your QAT tester. Push enter and you will see the wet bulb number. This is a more accurate reading for the compressed air humidity percentage (CAH).
